■ Recommended silicone oil
Silicone oil is one of the heat transfer media. Please select silicone oil (heat resistant dimethyl silicone oil, viscosity 100mm² / s [cSt] or less)

Manufacturer	Toshiba Silicone (or equivalent)	
Product name	TSF458-50	TSF458-100
Recommended temp.	Below 200°C	200°C~270°C
Appearance	Light yellow transparent	Light yellow transparent
Specific gravity (25°C)	0.961	0.963
Viscosity (25°C)	50mm²/s (cSt)	100mm²/s (cSt)
Volatilizatioin (150°C, 24h)	0.3%	0.3%
Viscosity temperature coefficient	0.59	0.59
Flash point	325°C	342°C
Pour point	-50°C or less	-50°C or less
Viscosity increase rate (300°C, 168h)	40%	35%

Degradation rate (change in viscosity) of silicone oil varies depending on temperature used. Especially in the case of TSF485-100 used at a temperature exceeding 200°C, as a guide, almost no change in viscosity is seen at 200°C, but it is about 1000 hours at 250°C and 100 hours at 270°C.

For further details, please inquire with silicone oil manufacturer when purchasing.

Cell Separation System
Disposable cell concentration chip

Cellpuri®

A disposable chip that concentrates cells without the centrifugation process. The chip enriches cells using rheological phenomenon inside the microchannels where cell suspension pass through to separate the cells from the media.

- User-friendly disposable cell concentration chip
- Enriches cells more than 20 times in 2 minutes
- Centrifugation-free workflow minimizes cell damage
- All processes are done inside the clean bench
- 95% recovery when cell washing
- Reduces human error as enrichment is automatically processed using the syringe pump

Its compact design allows for easy integration into clean bench environments, reducing contamination risks and enhancing overall cell safety during processing.

Filterless Filter (FLF Technology)

It is a microfluidic chip-based cell separation and concentration technology. Countless micrometer-sized channels inside the chip create a rheological flow that separates, concentrates, and removes particles of a specific size from the solution. Microchannels were strategically designed to isolate cells according to their size where larger cells are directed towards one side whereas smaller cells flow randomly on lateral axis that eventually compile on the other side. FLF technology can be applied to cell enrichment, white blood cell separation, and blood-plasma separation.

Cell Enrichment
Cellpuri® efficiently separated HL-60 cells from medium without spinning-down the cells and more than 20-fold enrichment (121.2x10 cells/mL) was observed in HL-60 cells at an initial concentration of 4.9 x 10 cells/mL.

Reduced Cell Clumping
Adherent cells, including MCF7 cells, tend to form clumps during the cell passage. But as shown in above images, enrichment using Cellpuri® reduces cell clumping while centrifugation pellets the cells and thus increasing the clumping cells.

1 ULF SERIES CHEST AND UPRIGHT ULTRA LOW FREEZERS

■ Features
- ● Digital temperature control with dual display and adjustable temperature range. Scan button for setting temperature and tamper proof lockout
- ● Quick pull-down to operating temperature with efficient and reliable cascade refrigeration. Two large hermetic compressors ensure rapid pull-down of product load. Because of the unique design of the freezers, the pressure in the refrigeration system is held very low, eliminating excessive heat build up. This low pressure allows the freezer to operate efficiently, extending compressor life.
- ● Compressor life is extended by an energy-saving low stage which operates only on demand.
- ● Compressors are protected with a constant flow of refrigerant
- ● Heat is efficiently and effectively dissipated by an air-cooled condenser with two heavy-duty fans. Condenser requires no liquid coolant
- ● Freezer has automatic timer system that restarts unit in case of power failure
- ● Frost and ice build-up along the gasket is minimized by a heater harness located beneath the channel
- ● CFC-Free R-508B and R-404A refrigerants

■ Primary Uses
- ● Clinics
- ● Research
- ● Small laboratories
- ● Hospital rooms
- ● Medical clinics

*1 Performance (excluding temperature rise time) is measured at rated voltage, 50Hz or 60Hz frequency, room temperature 23° C±5° C, humidity 65%RH±20%, and no load. Note that the maximum temperature in the temperature control range may not be reached if the power supply voltage is below the rating or if the outside temperature is low. *2 Temperature rise time is reference data for rated voltage, 50 Hz or 60 Hz, room temperature 23° C, humidity 65%, and no load. Note that the temperature rise time may be longer when the power supply voltage is below the rating or when the outside temperature is low. *3 If the product is used beyond the operating voltage range (±10% of rating), there is a possibility that the safety function will malfunction. Pay attention to the power supply voltage when using the product. *4 Protrusions are not included.

Key Existing Markets

The market for plasma surface treatment systems is driven by expanding applications across diverse industries and accelerated technological progress.

Building Materials

Adhesive Bond Strength Improvement: Building materials include a wide range of products from doors and windows to wallboard. Bond strength between adhesive and the many components of these products can be drastically improved with plasma.

Common materials include fiberglass, polyester, glass, polyethylene, and metal.

Automotive / Assembly

Adhesive Bond Strength: The automotive and assembly industries have begun incorporating lighter weight plastics and these require plasma activation to improve adhesive bond strength to acceptable levels.

Common materials include polypropylene, polyethylene, and polyester.

Composites

Resin Adhesion: The composites industry requires excellent adhesion between layered fibers/fabrics and resin.

Common materials benefitting from plasma treatment include fiberglass and carbon as well as specialty materials such as aramids, PEEK, and other plastics

HDPE Pipe

Improved Printability: HDPE is a very inert material which requires plasma surface treatment to adhere to ink for proper identification, safety labeling.
HDPE pipe is used for ground water, cable, and other underground uses. PE is used in a variety of other industries including medical, packaging, electrical insulation, as well as nets, toys, garbage containers, and other small parts like pens.

Performance Data

PSA Series plasma technology improves surface chemistry of difficult materials, allowing for better printability, better wetting, improved adhesion of coatings, and stronger bond strength of adhesives and glues.

● **Improved wettability and printability**

Many substrates have low surface energy, meaning they are difficult to wet, resist printing, and do not adhere or bond well to adhesives or coatings. *Treatment with the PSA Series cool plasma solves these problems, increasing surface energy, creating a wettable, printable surface that adheres well to coatings.*

| Evaporated water | Max. 3000mL/h | Temp. control range | 40 to 300°C | Sample flow | Variable up to 70ml/min. | Spray nozzle (selectable) | Two-way nozzle | Operation | Easy operation |

Spray drying of fine powder as small as a single micrometer with high collection rate

This spray dryer can produce fine particles from 1 to 100μm which are considered to be extremely difficult to produce in laboratories. It is useful for preliminary tests for pilot plant or expensive samples, micro capture spray drying research, substitute for general laboratory drying method etc.

DL410 is a larger capacity spray dryer that also does not require the liquid sample or solution to undergo any pre or post-processes such as filtration, separation, or pulverization. The use of organic solvents is fully supported with the attachment of our GAS410 organic solvent recovery unit. Small, expensive and/or heat sensitive samples can be dried quickly and efficiently with this easy to operate system.

- Processes samples as small as 0.5 g of solid matter
- Safe for heat-sensitive samples, such as food or medical products
- No risk of contamination
- Digital display of inlet/outlet temperature and drying air volume
- Detachable drying chamber, cyclone and product vessel
- Fast and easy clean up
- Universal power supply and multilingual touch screen controller

■ Easy operation and maintenance

- The hot air inlet and drying chamber cover automatically move up and down, and since the cyclone and product vessel can easily be removed, cleaning and maintenance after your experiment is easy
- Control functions are conveniently arranged on the control panel for various conditions
- The temperature recorder, air flow meter, pressure gauge and other measurements allow easy control of experiment conditions

● Dehumidifier (Freezer) integrated in GAS410. No extra freezer/dehumidifier equipment needed
● Compressor included, no need for a separate compressor to operate the spray dryer ADL311SA when using organic solvent samples
● Flammable or toxic solvents can be processed by combining a N₂ gas sealed circulation system and a solvent recovery system (with freezer and capacitor)
● Explosion safety with closed loop N₂ inert gas system
● Recovery of solvent to protect the environment and enable minimized pollution.
● Drying of easily oxidized materials is possible
● Supports low temperature drying of materials that easily deform with heat
● No freezing risk due to organic solvent with aqueous solution mixtures which could cause damage to the closed loop GAS410 system
● Spray drying and recovery of products and solvents are performed with meticulously devised safety measures

Organic Solvent Washing Unit

A unique vapor neutralizer using water or alkaline solution (Na$_2$CO$_3$, NaHCO$_3$)

GWS410

Max. flow	15L/min.

The world's first water-based solvent neutralizer designed primarily for spray dryers.

GWS410 traps contaminants in solvents by using tap water or alkaline solution at atmospheric pressure and room temperature.

GWS410 is designed with a washing tank --- when solvent vapor enters the tank, sprayed water adheres, cleans and neutralizes solvent particles, before returning to the bottom of the chamber.

- Uses water or alkaline solution
- Eliminates harsh solvents
- Minimizes equipment rust and corrosion
- Simple operation
- Easy maintenance --- only requires monitoring of water's pH level in the storage tank and condition of molecular sieves

■ Flow Diagram

■ Sample Installation
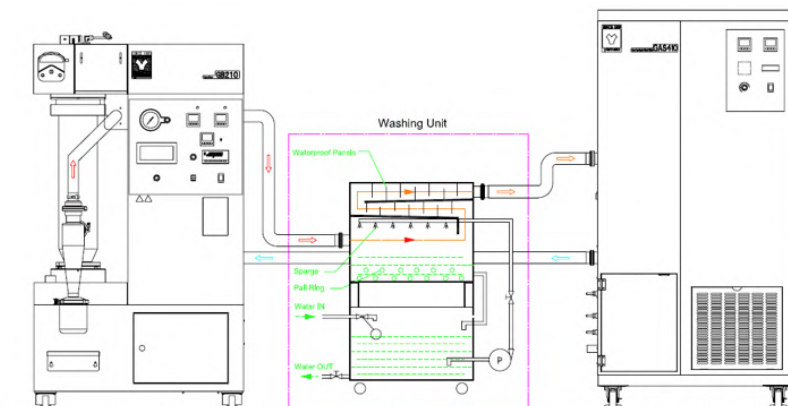

**Spray Dryer + GWS410 Solvent Vapor Neutralizer
+ GAS410 Organic Solvent Recovery Unit**

(1) Harmful gas **1** from spray dryer enters into the washing tank unit.

(2) It goes through **2** inside the washing tank and the filling rooms **3** and comes in contact with the cleaning fluid **4** sprayed by the spray nozzle. The harmful substance is then absorbed by the cleaning fluid.

(3) Moving through multiple-stage filling rooms, the gas goes through the smog collector **5** to prevent cleaning fluid discharge.

(4) With the aid of the blower, the gas enters into **6** GAS410 as clean air.

(5) The cleaning fluid **A** from the water storage tank enters into the washing tank through the circulating pump **B**, it spreads to the filling rooms **3** by means of spray nozzle **C**, and then goes through the pipeline **D** to return to the circulating water in the water storage tank.

The granulation process has many operation factors, the reproducibility depends on the skill level of the operation. The flow state of the granules has a significant impact on the test results. By adjusting the amount of hot air consistent flow conditions are achievable.

(Conditions)

Raw material	Sintered alumina (average particle size 40) 400g
Binder	5% PVA solution (#500) 25g
Inlet temperature	100°C
Binder liquid feed rate	12.4g/min
Binder spray times	6 times
Binder spray pressure	78kPa(0.8kg/cm²)
Nozzle height	25cm from microporous plate

Change of particle diameter
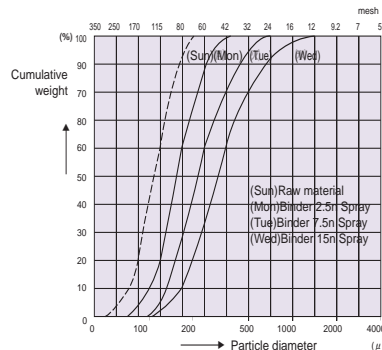

The factors that influence the particle diameter are the binder liquid feed rate and the spray pressure, the former being the most influential. A higher binder amount will result in larger diameter particles.

(Conditions)

Raw material	Lactose(100 mesh under) 200g
Binder	70% Sorbitol solution
Inlet temperature	90°C
Binder liquid feed rate	12g/min
Binder spray pressure	98kPa (1.0kg/cm²)
Nozzle height	25cm from microporous plate

Repeatability of granulation test
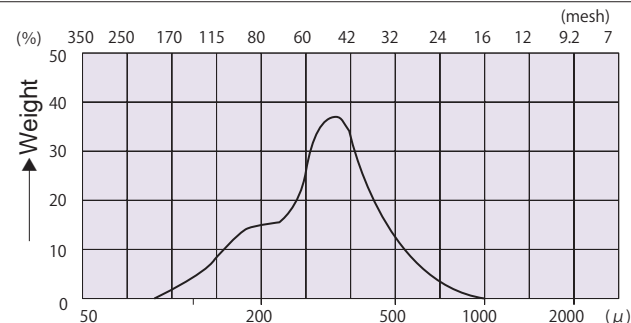

Particles generated by the pulvis mini bed are usually in the range of 0.1~1.5a, The particle size uniformity is lower than extrusion granulation and compression granulation methods.
The granularity consistency may be regulated by test conditions.

(Conditions)

Raw material	Lactose (100 mesh under) 200g
Binder	70% Sorbitol solution 7.3g
Inlet temperature	90°C
Binder liquid feed rate	12g/min
Binder spray times	7 times
Binder spray pressure	98kPa(1.0kg/cm²)
Nozzle height	22.5cm from microporous plate

Digital Laboratory Stirrer

LR500A/B Series

| Max. Speed Range | 1,000rpm | Operation | Low noise Maintenance free |

● DC brushless motor considered superior in safety as there are no brushes to cause sparks and no brush replacement required
● Direct-drive system reduces noise and require low maintenance
● Achieves high torque enabling stirring of high viscosity solution
● Digital tachometer for easy speed setting and

confirmation
● Load on the stirring shaft can be monitored by LED2 display. An overload lamp turns on when exceeding the maximum load, stopping the motor automatically
● Revolution feedback control function can maintain the setting rate despite change of load (especially suitable for high viscosity samples)

Water Circulator (Chiller)

Cold Trap

Water Circulator (Chiller)

Purpose

Supplies a source of temperature controlled fluid, typically water, which removes heat from a process

Benefits

Keeps water in the condenser at a stable low temperature thereby creating ideal conditions for collecting the maximum amount of solvent

Cold Trap

Purpose

Efficiently collects moisture and harmful vapors by trapping them in the container and keeping them from reaching the vacuum pump

Benefits

Protects vacuum pumps
For oil-sealed pumps, collection of vapors is critical to prevent them from getting into the vacuum pump where they would condense and contaminate the pump's oil which will eventually cause loss of efficiency or irreparably damage pump

Protects the environment
For dry pumps, collection of vapors makes the evaporation system a closed system, preventing vapors from passing through the vacuum pump and into the environment

Increases evaporation rate
Vapors are collected as a frozen solid and are therefore not condensed inside the vacuum tubing, which would slow evaporation

Precision low temperature, compact water circulator

CB-100

MADE IN JP

Operating temp. range	-10°C ~ 80°C

Capacity	~3.4L (Liquid volume 2.3L)

■ Operation and functions

● **Wide temperature range of -10 ~ 80°C**
Can be used for various applications such as as maintaining temperature for cell samples in a spectrofluorometer and a viscometer

● **High head and flow rate**
Lift is ~3.3/4.7m (50/60 Hz), which is very high in this class, so even piping with pressure loss can be circulated sufficiently. In addition, the maximum flow rate is as large as ~6.8/8.0L/min (50/60 Hz).The lift and flow rates allow stable circulation even when installed under a desk.

● **Easy to clean cooling air intake filter**
Filter mounting plate located on the front of the unit can be easily removed when cleaning

● **Standard equipped with drain**
Maintenance work such as replacement of liquid can be easily performed. After use, it can be stored in the space inside the main unit.

● **Nozzle can be used in any orientation**
Since the nozzle is freely rotatable, it can be installed in any direction

● **Compact**
With a width of 180mm and a depth of 360mm, it is ideal for limited spaces

● **Low GWP value that is friendly to the global environment**
Since the alternative CFC refrigerant R-134a is used, the global warming potential is as low as 1430, good for the global environment.

Reverse Osmosis Pre-treatment

Perfect addition to any lab water system!

HPL-RO

MADE IN THE USA

| Syetem output | 100g/day |
| Rejection rate | >93 % total dissolved solids |

HPL-RO system uses feed water pressure to purify the water through a reverse osmosis membrane. The 4-stage filtration process reduces dissolved salts and organics from the water. The permeate water is conveniently stored in storage tank while the concentrated salts are sent to drain.

The HPL-RO system can increase the DI cartridge capacity by 10 times. For low Total Organic Carbon (TOC) applications, reverse osmosis can significantly reduce levels to allow the polishing system to remove the final trace amounts.

Features
- Wall mounted design
- Four stage filtration
- Fourteen (14) gallon bladder tank
- Easy filter changes
- Variety of option including booster pump and high capacity membranes
- **Low ownership cost**
